

Introducing the

Universal Deer Feeder Mount

“The deer feed only comes through when you are ready”

TARGET MARKET:

- Hunters
- Deerfeeder companies

FEATURES:

- Eliminates losing grain when feeder control unit is removed
- Allows for mounting of the feeder control unit without tools.

PATENT INFORMATION:

A provisional patent application was filed in November of 2019. The Mars Rising Network performed the patent search and concluded there is nothing similar to this product on the market, which means this unique device could be patented and used everywhere.

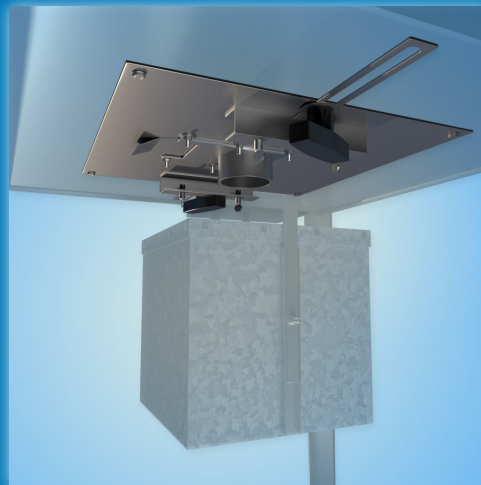

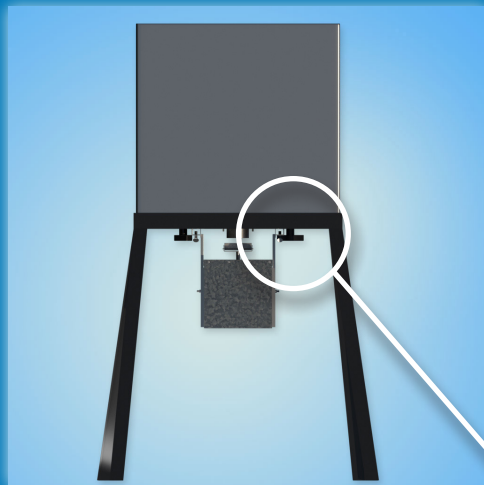

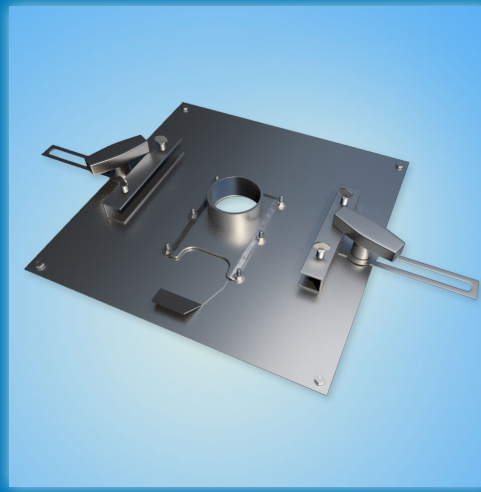

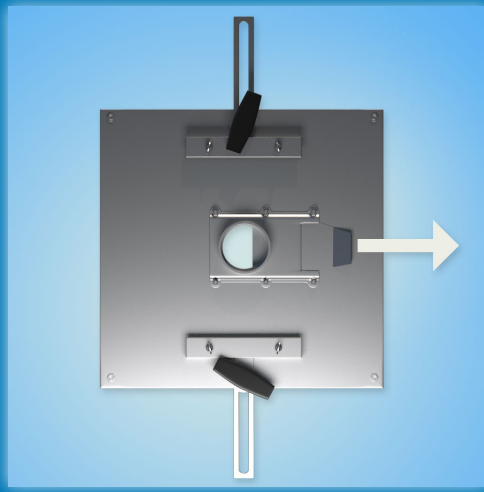

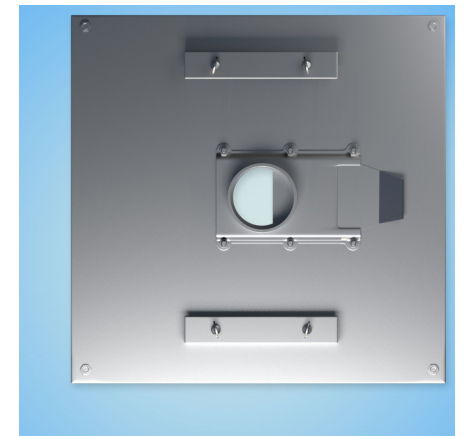

SUMMARY:

When working with a Deer Feeder you fill your grain tank and the grain falls through onto the feeder control unit, which distributes the grain onto the ground. But, when the feeder control unit doesn't preform correctly or stops unexpectedly, the unit must be replaced.

The **Universal Deer Feeder Mount** eliminates this problem completely. It has a closable gate that allows the feed hole from the barrel to be closed in case of problems or just needing to install a different feeder control unit.

It eliminates the need for tools and trying to find something to stop the feed from pouring out of the feeder when the feeder control unit is removed. As these are set up in remote areas, there is rarely something available to cover the hole and stop the loss of grain.

The Universal Deer Feeder Mount accepts 12 volt & 6 volt feeder control units. It can also be made as a fixed position feeder mount as seen in the photo below.

Background of Invention

I have hunted wildlife my whole life and every time I went to fill up wildlife feeders the same thing always happened. I would go to the feeder and fill it up with any wildlife feed and then test the feeder. Upon the test the feeder control unit would be broke and now I would have to find something to plug up the hole in the wildlife feeder funnel. I then designed this device to be a permanent fix to this problem for any wildlife feeder. The device mounts under the wildlife feeder and has a integrated gate to effectively close off the flow of feed and not allow the feed to pour out when the feeder control unit is removed from the wildlife feeder. It saves time by not requiring tools and money from not wasting feed that falls out when the feeder motor unit is removed from the wildlife feeder.

About the Developer

David Adams of Mount Pleasant, TX has created a prototype with a simple but effective solution He then contacted the Mars Rising Network and had a provisional patent application filed. Working with Mars Rising Network, he had the invention refined with the hope of turning this great idea into a real product. He is actively seeking a company that would have an interest in partnering with him to get this product on the market.
