

## Introducing the

# Phone Alert™

“No More Leaving Your Phone Behind”

### TARGET MARKET:

- Potentially every cell phone user in the world, estimated in 2017 at 4.77 billion people
- Parents who want to make sure their kids have their phones.

### FEATURES:

- Can be worn with a bracelet or attached to a keyring.
- Inexpensive and easy to manufacture

### PATENT INFORMATION

A provisional and design patent application has been filed as of September 2017. The patent search was performed by The Mars Rising Network. It was concluded that there is nothing similar to this product on the market, which means this unique, device could be patented and brought into people's lives.

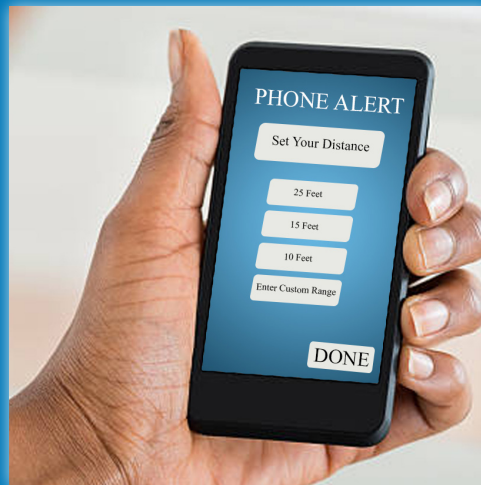

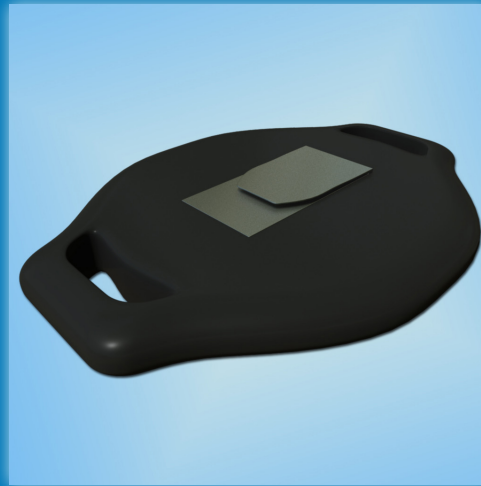

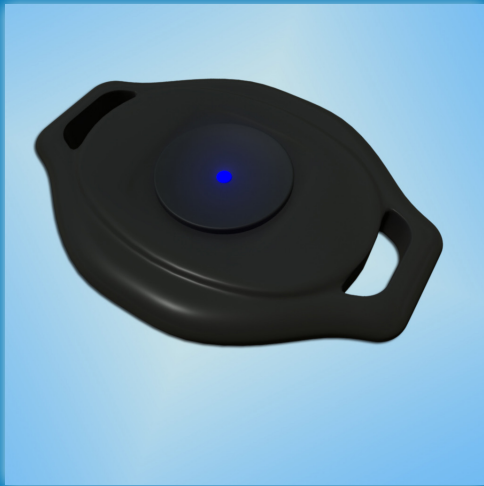

### SUMMARY

The **Phone Alert™** system is a combination of a small physical device and a phone app that work together which informs the user when they have walked out of range of their phone.

The physical part of the invention is a small fob which is universal and can attach to many different things including, but not limited to: Wrist bands, necklace, pocket, key chain, and etc. The device is simple and has one button on it which is used for multiple purposes.

The button turns the physical device on and off, but also syncs to the BlueTooth™ for a phone; similar to how any wireless motorcycle communication device for helmets work. The device also has an LED light on it which will blink in specific colors and patterns to indicate if it's powered on, and connected to your phone. Once paired, the device will ideally vibrate and/or beep once the user is out of range of their phone.

The App allows the user to turn on and off the tracking of the device, essentially, in the event the user needs to walk away from their phone for a few moments and doesn't want to turn the device off they can simply stop the tracking to keep the physical device from responding. Once they desire to have it respond again they can just hit the start button and it will resume. The app also features an indication icon allowing the user to know if the device is being tracked or not. This would be a simple informational feedback. This is a small, inexpensive, and quick way to keep you in range of your phone at all times so you lower the risk of losing it.

**About the Developer**

The inventor, Douglas D. Freeland, lives in Spirit Lake, ID and had an idea to help people who are always leaving their phones behind. Douglas contacted the Mars Rising Network and had a provisional and design patent application filed and had the invention designed properly so that he may see success with this great idea and turn it into a real product. He is actively seeking a company that would have an interest in licensing the product for a royalty.
